

Appln. No. 10/695,113

Attorney Docket No. 10541-1874

## I. Amendments to the Claims

1. (Currently Amended) A system for identifying a location of a vehicle, the vehicle including a controller for monitoring status of a component of the vehicle, the system comprising:

a sensor configured to transmit a component ID signal and a component status signal;

a first receiver remote from the vehicle and configured to collect a component ID signal from the sensor;

a processor in communication with the first receiver and adapted to receive and correlate the component ID signal to a location of first receiver; and

a database in communication with the processor for storing the component ID and the receiver location, wherein the processor is configured to correlate the component ID with a vehicle ID and a location of the first receiver to determine a vehicle location.

2. (Original) The system according to claim 1, wherein the processor is configured to correlate the component ID with a time that the component ID was received.

3. (Original) The system according to claim 1, wherein the sensor includes a radio frequency transmitter.

4. (Original) The system according to claim 1, wherein the sensor is a pressure sensor.

5. (Original) The system according to claim 1, wherein the sensor is mounted inside a tire.

6. (Original) The system according to claim 1, wherein the sensor is a tire pressure sensor mounted to a wheel of the vehicle.

Attorney Doc let No. 10541-1874

7. (Original) The system according to claim 1, wherein the component ID signal and the location of the first receiver are transmitted to the processor and the processor is located in a remote location to service a plurality of receivers.

8. (Original) The system according to claim 7, further comprising a second transmitter and second receiver connected between the first receiver and the processor.

9. (Original) The system according to claim 1, wherein the component ID has greater than  $2^{64}$  combinations.

10. (Original) The system according to claim 1, wherein a vehicle identification number is correlated with the component ID signal.

11. (Original) The system according to claim 1, further comprising a user interface that indicates a time and the location the component ID was received.

12. (Original) The system according to claim 1, wherein the user interface indicates a time and the location that a component ID was received in response to a vehicle identification number input.

13. (Original) The system according to claim 1, wherein the user interface indicates the traffic density based on the location of the receiver.

14. (Currently Amended) A system for identifying a location of a vehicle, the vehicle including a controller for monitoring status of a component of the vehicle, the system comprising:

Attorney Docket No. 10541-1874

a sensor for measuring a tire pressure and configured to transmit a component ID signal and a component status signal;

a receiver remote from the vehicle and configured to collect signals from the sensor;

a processor in communication with the receiver and adapted to ~~correlate~~ obtain the component ID and ~~the location of the receiver;~~ and

a database in communication with the processor for storing the component ID and the receiver location, wherein the sensor is a tire pressure sensor mounted to a wheel of the vehicle, wherein the processor is configured to correlate the component ID with a vehicle ID and a location of the first receiver to determine a vehicle location.

15. (Original) The system according to claim 14, wherein the processor is configured to correlate the component ID with a time that the component ID was received.

16. (Original) The system according to claim 14, wherein the sensor includes a radio frequency transmitter.

17. (Original) The system according to claim 14, wherein the component ID signal and the location of the receiver are transmitted to the processor and the processor is located in a central location to service a plurality of receivers.

18. (Original) The system according to claim 14, wherein the component ID has greater than  $2^{64}$  combinations.

19. (Original) The system according to claim 14, wherein a vehicle identification number is correlated with the component ID signal.

20. (Original) The system according to claim 14, further comprising a user interface that indicates a time and the location the component ID was received.

21. (Original) The system according to claim 14, wherein the user interface indicates a time and the location that a component ID was received in response to a vehicle identification number input.

22. (Original) The system according to claim 14, wherein the user interface indicates the traffic density based on the location of the receiver.
